

Alberta Population Projection

2012–2041

1. Highlights

This document presents population projections¹ as of July 1 for Alberta and each of its 19 census divisions² from 2012 to 2041, under three different sets of assumptions (i.e. low-, medium- and high-growth scenarios). These projection results are available by sex and single year of age. Please refer to the appendix for a complete list of these census divisions.

¹ The terms “projection” and “forecast” are often used interchangeably and it applies here as well. Strictly speaking, however, a population projection is a simulation primarily based on historical trends, whereas a population forecast also incorporates demographic and economic assumptions which may have noticeable impact on these trends. Therefore, the scenarios presented here more closely resemble forecasts instead of projections.

² Readers are cautioned that these population projections have been developed at the census division level. Within a particular census division, there could be wide differences in fertility, mortality and migration patterns. Individual municipalities within the census division may thus experience very different growth trends from the census division in which they reside.

It should be noted that population projections are not predictions. Thus, what these projections represent is a plausible evolution of the population based on the current population base and assumptions regarding future demographic developments.

Here are some highlights of the projections:

Population growth to continue, but at a moderating pace...

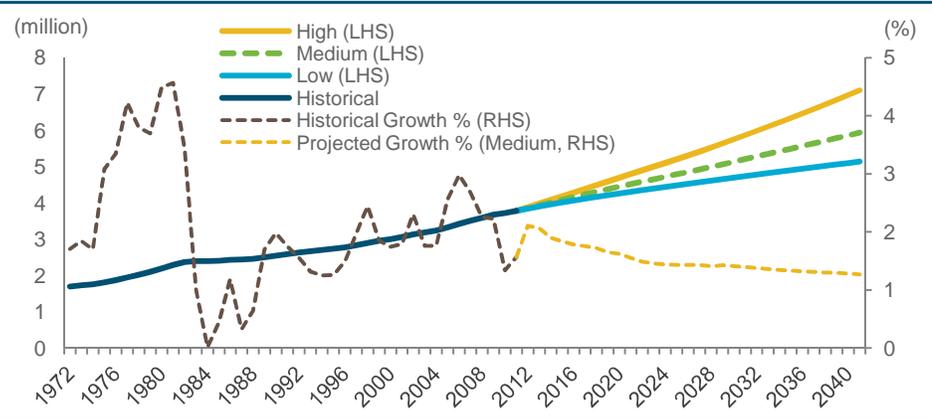

Alberta’s population is expected to continue to grow through 2041. By the end of the projection period, Alberta’s total population is projected to expand by over 2 million people to reach almost 6 million under the medium scenario (Figure 1). Under the low and high scenarios, Alberta’s total population is forecast to top 5 and 7 million, respectively, by 2041.

However, the pace of population growth is expected to slow gradually over the projection period. In the medium case, the annual population growth rate for Alberta is projected to moderate from about 2.0% in the short term to about 1.3% over the long term. Overall, Alberta’s population would grow by 1.5% annually over the next three decades, lower than the average rate of 1.9% experienced over the past two decades.

International migration is expected to be the primary growth driver...

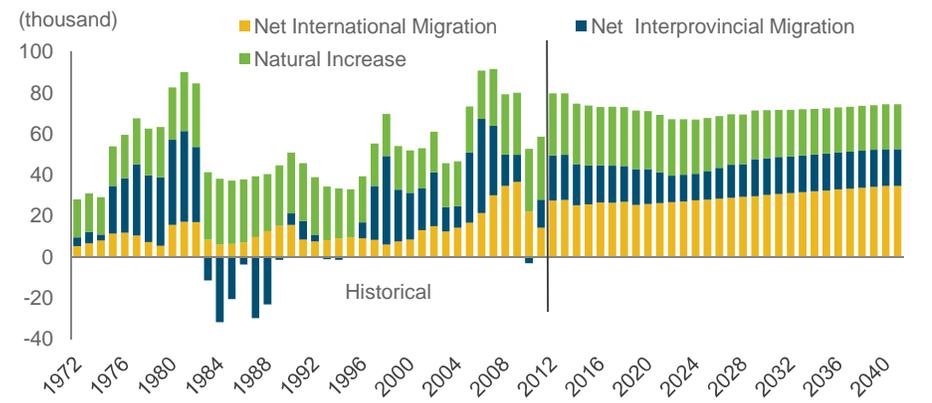

In all three scenarios, future population growth is mainly driven by migration, particularly by international migration. For the period between 2012 and 2041, net migration is projected to account for 65%, or 1.4 million people, of all population growth in the province under the medium-growth scenario, with natural increase accounting for the remaining 35% (Figure 2). Of the anticipated 1.4 million net migrants, 63%, or 874,700, would come from other parts of the world.

Albertans are expected to have fewer children and live longer...

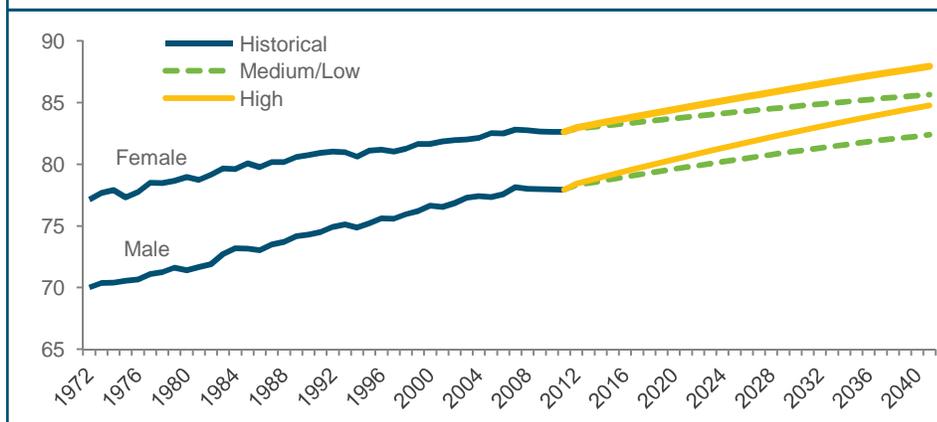

Alberta’s total fertility rate (TFR) has been on the rise for almost a decade, peaking at 1.93 in 2009. This increase is a reversal of a very long term downtrend that saw the provincial TFR drop to a low of 1.66 in 2002. Over the projection period, Alberta’s TFR is projected to decline gradually to a long-term historical average of about 1.76. However, the annual total number of births to Albertans is still expected to grow by almost 30% by the end of the projection period, largely due to an expanding population.

Albertans are expected to live longer in the future. In the low and medium scenarios, the life expectancy at birth for females is projected to rise from 82.6 years in 2011 to 85.6 years in 2041, and to rise from 77.9 years to 82.4 years for males (Figure 3). In the high scenario, females are expected to live more than 5 years longer to reach 87.9 years by 2041, while males are projected to live almost 7 years longer to 84.8 years. The life expectancy gap between female and male is projected to narrow from 4.7 years in 2011 to 3.2 years in all scenarios.

Aging process to accelerate...

Due to declining fertility and rising life expectancy, Alberta’s population is aging, although it still has one of the youngest populations in the country. Under the medium scenario, the median age of Alberta’s population is projected to climb from 36 years in 2011 to 37 years in 2020, and rise further to 40 years by the end of projection period.

FIGURE 3: LIFE EXPECTANCY AT BIRTH, HISTORICAL (1972–2011) AND PROJECTED (2012–2041)

Sources: Statistics Canada and Alberta Treasury Board and Finance

The baby boomers, who were born between 1946 and 1965, accounted for almost a quarter of Alberta’s total population in 2011. As this group ages, the aging process in Alberta is expected to accelerate until 2030, when the last group of baby boomers reaches the age of 65. As a result, the proportion of seniors in the overall population is projected to rise significantly. The total number of people aged 65 and over is expected to more than double to range between 1.1 (low scenario) and 1.2 million (high scenario), or 16.8% (high scenario) to 21.4% (low scenario) of the total population in 2041, up from 10.8% in 2011 (Figure 4). Furthermore, seniors are anticipated to outnumber children (aged 0-14) by 2030.

The proportion of older seniors aged 80 years and over would increase sharply in the future as well. By the end of the projection period, about one out of every 17 Albertans would be 80 years and over under the medium scenario, compared to one in 34 in 2011. Meanwhile, the number would more than triple from the current level of about 110,500 in 2011 to over 363,000 by 2041.

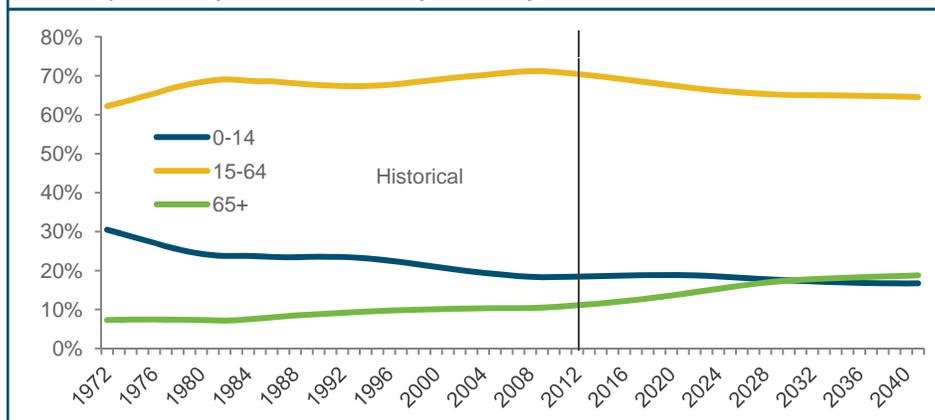

This aging process also can be presented by changes in the population pyramids. As shown in Figure 5 (next page), over the next three decades, the base and the body of Alberta’s population pyramid are expected to narrow, while its upper section would expand considerably. More specifically, all age groups under 57 are expected to see their population shares shrink, whereas those aged 57 and over would see their shares rise.

More people are expected to depend on the working age population...

The number of working age (15–64) Albertans is expected to grow from almost 2.7 million in 2011 to 3.8 million by 2041 in the medium scenario. However, in terms of share of total population, this age group is anticipated to shrink, falling from 71% in 2011 to under 65% by 2041 (Figure 4).

Due to the rising share of seniors and the declining share of working age population, the total dependency ratio, which is the number of children (0-14) and seniors (aged 65 and over) per 100 working age people (15–64), is expected to increase significantly

FIGURE 4: PROPORTION OF TOTAL POPULATION BY AGE GROUP, MEDIUM, HISTORICAL (1972–2011) AND PROJECTED (2012–2041)

Sources: Statistics Canada and Alberta Treasury Board and Finance

over the projection period. By 2041, the ratio would increase to over 55 in all scenarios, compared to 41 in 2011.

Population growth not evenly distributed, but all divisions are expected to get older...

At the sub-provincial level, five census divisions' total population is expected to grow faster than the provincial average under the medium scenario (Figure 6).

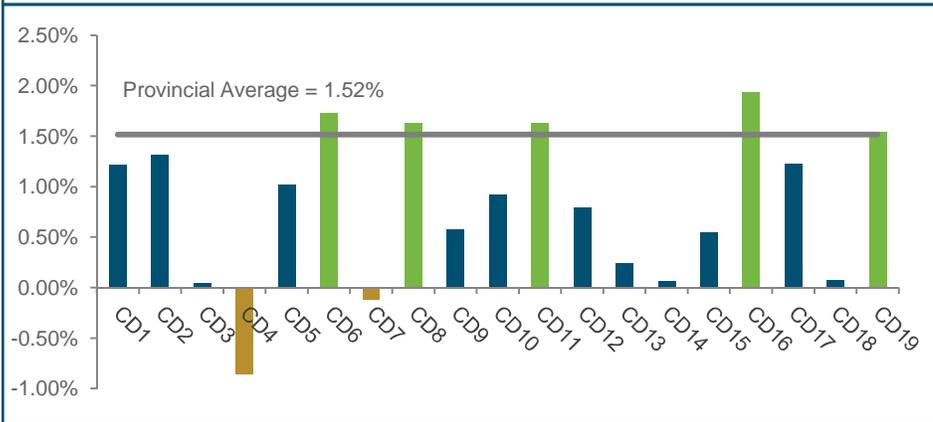

These census divisions are: CD6 (Calgary), CD8 (Red Deer), CD11 (Edmonton), CD16 (Wood Buffalo), and CD19 (Grande Prairie). In Particular, CD16 would lead the province with the highest average annual growth rate of 1.9% between 2012 and 2041, largely due to the strong inflow of migrants driven by the oil sands developments in this region.

Seventeen out of the 19 census divisions are forecast to have a larger population by 2041, but CD4 (Hanna) and CD7 (Stettler) are projected to see their population shrink compared to 2011 (Figure 6).

The urbanization process is expected to continue during the projection period. The share of population living in the two most urbanized census divisions, CD6 (Calgary) and CD11 (Edmonton), is projected to grow from about 69% in 2011 to over 72% in 2041 according to the medium scenario.

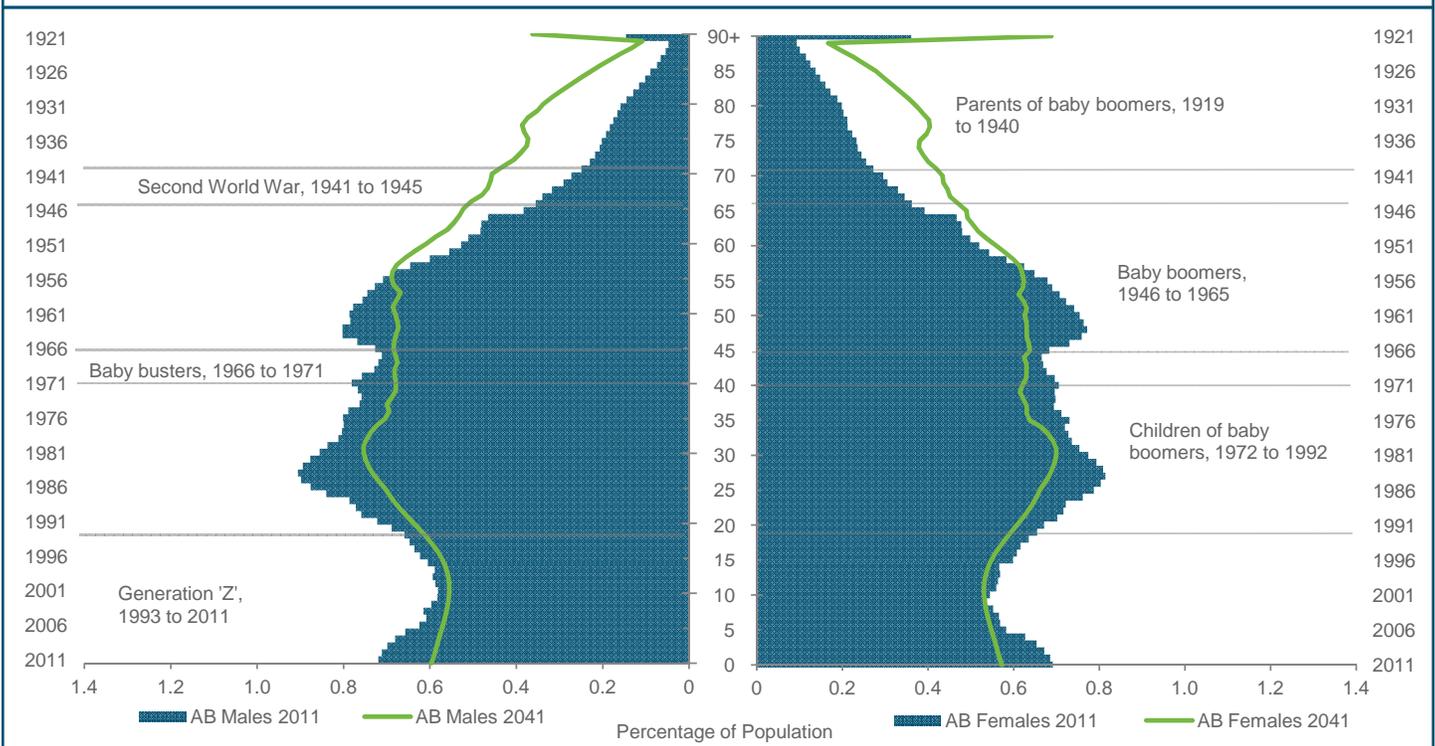

All of the census divisions are expected to shift to an older age structure. In 2011, CD16 (Wood Buffalo) had the lowest share of seniors (people aged 65+) in its population (2.3%), while CD3 (Pincher Creek) had the highest share at 17.4% (Table 1 on the next page). By 2041, the share of seniors across the province is expected to increase, ranging from a low of 12.8% in CD19 to a high of almost 30% in CD4 under the medium scenario.

2. Methodology and Assumptions

These population projections use the component method to project the future size and age/sex characteristics of the population. This method is essentially a demographic accounting system. It starts with the base-year population distributed by single year of age and sex. Everyone is aged ahead a year. Then it applies fertility, mortality and migration assumptions to the base population to project the number of births, deaths, and migrants that occur during the year. Finally, these three components are either added or subtracted from the base population to obtain the population projection for the subsequent years, by age and sex.

This methodology is applied to each of the 19 census divisions in Alberta to ensure consistency and comparability. The population projection for Alberta as a whole is generated by adding the projected populations for the 19 census divisions.

The assumptions for fertility (births), mortality (deaths), and migration are based on detailed analysis of historical trends. Three different scenarios (i.e., high, medium and low) have been prepared. The medium scenario represents the most likely case, and as a result, is the reference scenario over the projection period. The high scenario captures the possibility of higher growth in certain component(s) and consequently higher population growth, whereas lower growth is projected under the low scenario.

The base population for this projection comes from Statistics Canada’s postcensal estimates of the population in Alberta as of July 1st, 2011. These estimates were based on the 2006 Census and adjusted for net undercoverage. The total population was broken down by sex and by single year of age up to the age group of 90 years and over.

Note that Statistics Canada’s population estimates include only the resident population (as defined by the census, upon which the estimates are based). Therefore, people can

be a non-permanent resident (NPR) and be included in the base population, whereas the “shadow population” or “mobile population”, is not included since the primary residences for these individuals are located either outside the province of Alberta or within other census divisions. They are therefore enumerated by Statistics Canada in the Census as residents of other jurisdictions.

2.1 Fertility Assumptions

The fertility assumptions are developed based on the analysis of past trends. Historically, there were significant variations in the fertility rates among census divisions within the province. The potential reasons for these variations include average income levels, female educational attainment, employment opportunities for females, and the proportion of Aboriginals in the overall population, etc. For instance, since females living in the major urban centers such as Calgary and Edmonton have more educational and career opportunities, they tend to have babies later in their lives and have fewer children compared to women from other parts of the province. On the other hand, because Aboriginal people tend to have higher fertility rates and bigger family sizes, areas such as CD3, CD17 and CD18, where Aboriginals account for a relatively large proportion of their overall populations, also have higher fertility rates.

Based on the similarity in historical trends, the CDs have been divided into seven groups to develop the fertility assumptions (Table 2, next page). Over the long term, the projected TFRs range from the low of 1.37 for group 1 (i.e. CD15) to the high of 2.96 for group 7 (i.e. CD17).

Alberta’s total fertility rate has been increasing in recent years. This increase is a reversal of a very long term downtrend that saw the provincial TFR drop to a low of 1.66 in 2002. In the medium scenario, the TFR is assumed to decline gradually from 1.92 in 2011 to a long term historical average of about 1.76 (Figure 7, next page). In the low scenario, the total fertility rate is projected to fall further than the medium case and reach 1.60. The projected rate of 1.60 is equal to the long-term average total fertility rate (1986–2007) for Canada. In the high scenario, the total fertility rate is assumed to rise gradually and stabilize at the population replacement level of 2.10.

TABLE 1: PROPORTION OF POPULATION AGED 65 AND OVER, 2011 VS 2041 (MEDIUM)

Census Division	Major City/Town	2011	2041
Alberta		10.8%	18.8%
CD1	Medicine Hat	14.3%	20.3%
CD2	Lethbridge	12.8%	18.7%
CD3	Pincher Creek	17.4%	23.8%
CD4	Hanna	15.4%	29.9%
CD5	Drumheller	13.9%	21.1%
CD6	Calgary	9.7%	18.9%
CD7	Stettler	15.0%	25.2%
CD8	Red Deer	11.1%	18.0%
CD9	Rocky Mountain House	13.1%	23.2%
CD10	Camrose	15.7%	20.5%
CD11	Edmonton	11.3%	18.7%
CD12	St. Paul	11.1%	19.1%
CD13	Whitecourt	15.2%	25.1%
CD14	Edson	10.5%	21.7%
CD15	Banff	9.6%	24.5%
CD16	Wood Buffalo	2.3%	13.2%
CD17	Slave Lake	7.6%	13.6%
CD18	Grande Cache	10.0%	23.2%
CD19	Grande Prairie	8.7%	12.8%

One of the significant fertility trends observed in recent years is the postponement of having children among women. That means more females are delaying childbearing and have their first child in their late 20s or early 30s. Over the projection period, we expect this trend to continue as females continue to pursue post-secondary education and employment opportunities. However, the pace of change is expected to be more moderate compared to what we have experienced over the past decade (Figure 8).

2.2 Mortality Assumptions

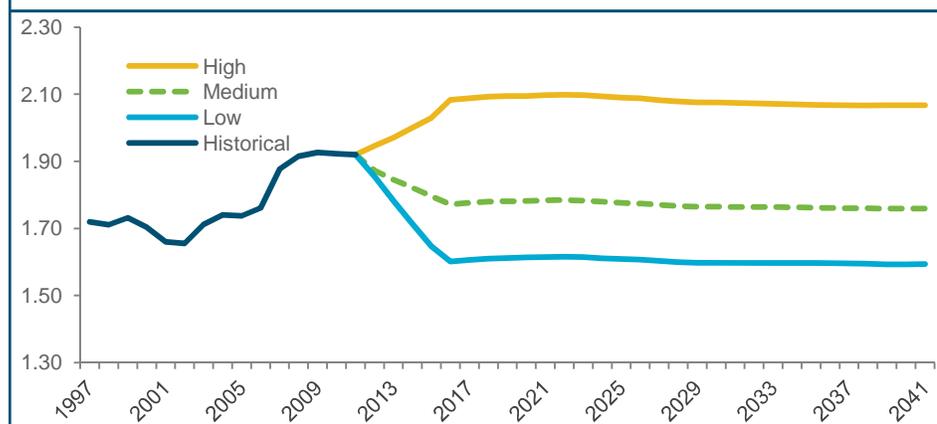

The method used to project mortality is based on the Lee-Carter model (1992)³. This model essentially breaks down the age-specific mortality rate into three components: an age-specific constant term, a time-varying mortality index, and an age-specific component that measures how fast mortality at each age varies when the mortality index changes. Then, with the projected mortality index, age-specific mortality rates can be calculated for future periods. The province was divided into two groups to develop the mortality assumptions, major urban regions (CD6 and CD11) and other regions (all other census divisions).

Two sets of mortality assumptions (low/medium and high) were developed. Under both scenarios, life expectancy at birth in Alberta is expected to continue its upward trend in the future. Under the low/medium scenario, life expectancy at birth for females is expected to gain 3.0 years from 82.6 in 2011 to 85.6 by 2041, while it would increase by 4.5 years to 82.4 for males (Table 3, next page). A higher growth profile is introduced in the high scenario. Life expectancy at birth for females would reach 87.9 years in 2041 for a gain of 5.3 years; males would add 6.8 more years to their life expectancy to a total of 84.8 years by the end of the projection period.

Under both scenarios, males' life expectancy at birth is assumed to grow at a faster pace than females' life expectancy. This is consistent with recent historical trends

TABLE 3: LIFE EXPECTANCY AT BIRTH, HISTORICAL (1997-2011) AND PROJECTED (2012-2041, MEDIUM)

Year	Alberta		Major Urban Centers (CD6 & CD11)		Rest of Alberta	
	Female	Male	Female	Male	Female	Male
1997	81.2	75.6	81.2	76.2	80.1	73.9
2001	81.9	76.5	82.4	77.1	81.0	75.8
2006	82.5	77.6	83.0	78.5	81.6	75.8
2011	82.6	77.9	83.4	78.9	81.1	76.1
2012	82.9	78.3	83.5	79.0	81.2	76.4
2021	83.8	79.8	84.3	80.4	82.2	78.0
2041	85.6	82.4	86.0	82.9	84.1	80.8

Sources: Statistics Canada and Alberta Treasury Board and Finance

where males have experienced larger gains than females. Therefore, the gender gap is projected to continue to shrink. In all scenarios, this gap would fall from 4.7 years in 2011 to 3.2 years in 2041.

Province-wide, people living in the major urban centers (i.e. CD6 and CD11) tend to live longer. For instance, females’ life expectancy at birth in the major urban centers was 83.4 years in 2011, more than two years longer than that from other parts of Alberta (Table 3). However, the improvement in life expectancy is projected to be more significant in the rural areas. Over the projection period, females’ life expectancy at birth is expected to increase by 2.7 years in the major urban centers, compared to a gain of 3.0 years for the rest of Alberta; males in major urban centers are projected to live 4.0 years longer, smaller than the gain of 4.7 years for other regions.

2.3 Migration Assumptions

International Migration

International migration will continue to be driven by immigration, which is ultimately determined by federal government’s immigration policies. Based on the historical trends, three immigration scenarios have been developed to capture the policy uncertainty. After hitting a low of 6.0% in 1998, Alberta’s share of immigrants at the national level has been increasing, mainly due to the province’s strong economy and labour market. In 2011, 11.7% of the total immigrants moving to Canada decided to settle in Alberta. Over the long term,

Alberta’s share is expected to increase further because of the anticipated robust economic growth. However, the pace of increase will be relatively moderate. By the end of the projection period, the share would reach about 13%, or 45,200 immigrants. Immigration is projected to reach 60,000 and 32,700, respectively, under the high and low scenarios by 2041.

Net emigration (i.e., emigration minus returned emigrants plus net temporary emigration), is assumed to increase gradually, as the province’s population expands. Meanwhile, after experiencing the biggest annual net outflow of 8,000 in 2011, the flow of non-permanent residents (NPRs) to Alberta has been recovering in recent quarters. Over the short term, Alberta is expected to gain NPRs again,

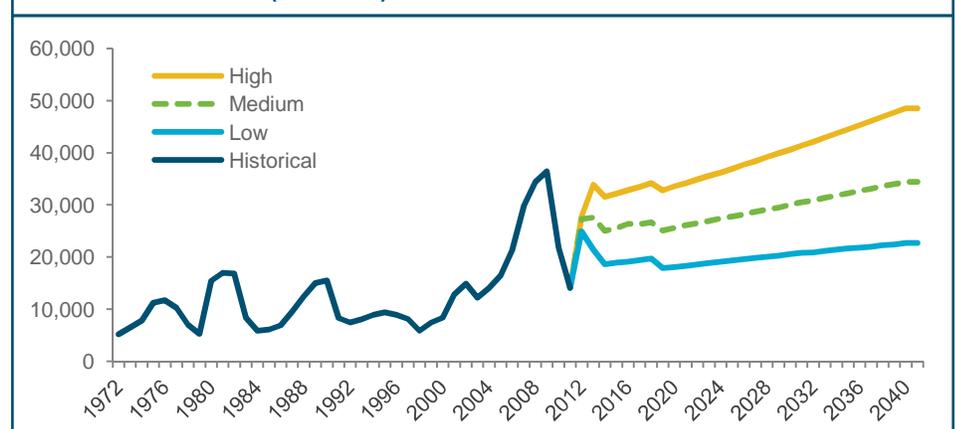

but the magnitude is projected to be much smaller than the ones we have seen during the 2006-2009 period. Over the long term, the flow of NPRs is expected to return to a more balanced condition, i.e., inflows would be completely offset by outflows.

Overall, net international migration to Alberta under all three scenarios is expected to increase significantly in 2012 as a result of the anticipated recovery in the net inflow of NPRs (Figure 9). By 2041, Alberta is expected to gain about 22,700 net international migrants under the low scenario, and about 34,400 and 48,500, respectively, under the medium and high growth scenarios.

Interprovincial Migration

Net interprovincial migration is strongly driven by Alberta’s economic performance relative to other provinces. Alberta’s Budget 2012 forecasts that the province will enjoy robust economic growth in the near future due to the positive outlook in business investment and exports. Furthermore, Alberta’s labour market is expected to remain strong. As a result, net interprovincial migration to Alberta is projected to grow further in the next few years. However, as oil sands investment moderates over the medium term (according to private sector forecasters such as the ERCB), our assumed net inflow of interprovincial migrants moderates as well. In the long term, net interprovincial migration is projected to move back gradually to a

FIGURE 9: NET INTERNATIONAL MIGRATION TO ALBERTA, HISTORICAL (1972–2011) AND PROJECTED (2012–2041)

Sources: Statistics Canada and Alberta Treasury Board and Finance

long-term average of about 18,000 under the medium scenario (Figure 10). In the high and low scenarios, net interprovincial migration is assumed to reach 28,500 and 9,500, respectively, by 2029 and remain constant afterward.

Intraprovincial Migration

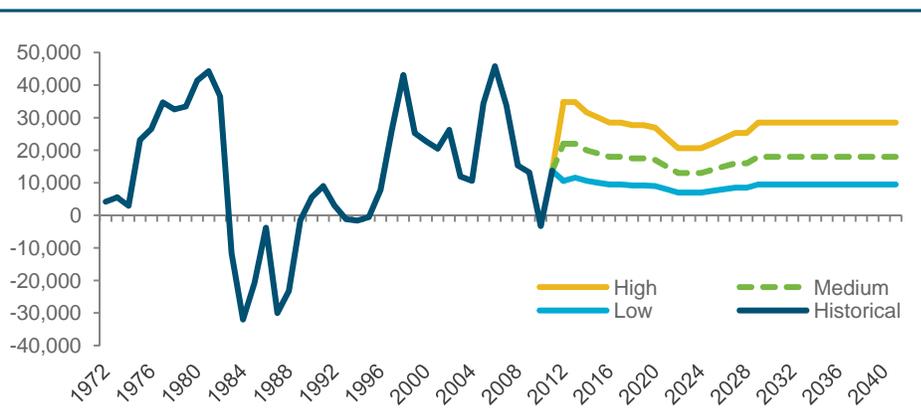

The projected number of people moving between census divisions, i.e., intraprovincial migration, is developed using the long-term averages. Since intraprovincial migration has no impact on Alberta’s overall population growth, only one scenario has been developed in this projection. Over the next thirty years, about three quarters of the net intraprovincial migrants within Alberta are expected to move to the two biggest urban centers, Calgary and Edmonton, for educational and employment opportunities.

Total Net Migration

Combining all migration components, total net migration to Alberta is expected to continue the momentum from 2011 and reach 49,300 in 2012 under the medium scenario, as the province attracts large inflows of both international and interprovincial migrants (Figure 11). This level is projected to decline slightly over the medium term, as the net flow of NPRs returns to a more balanced level and net interprovincial migration moderates. However, it is projected to resume the upward trend in 2022 as more immigrants move to the province. By 2040, Alberta is expected to receive 52,400 net migrants annually. Under the low and high growth scenarios, total net migration to Alberta would reach 32,200 and 77,000, respectively, by 2040.

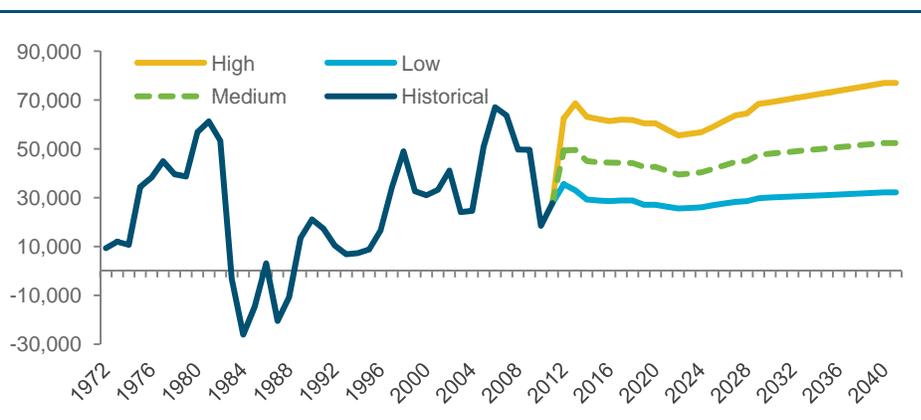

Within the province, regions with more employment and educational opportunities tend to attract more migrants. Of the anticipated 1.4 million net migrants moving to Alberta over the next thirty years, almost 84% would choose to settle in the two major urban centers, i.e. CD6 (Calgary) and CD11 (Edmonton). Areas with a lot of oil sands developments, such as CD16 (Wood Buffalo) are expected to attract migrants as well. However, given the uncertainties in developing the oil sands resources, as well as the timing of these oil sands projects, these areas are also expected to see more volatility in their migration flows.

3.4 Glossary

Age Specific Fertility Rate	Number of births per 1,000 women of a specific age within the childbearing age range, normally age 15 to 49 years.
Aged Dependency Ratio	Ratio of population aged 65 and over to the labour force population (aged 15-64).
Baby Boomer Period	Period following World War II, 1946–1965, marked by an important increase in fertility rates and in the absolute number of births.
Components of Population Growth	Births, deaths and migration are components that alter the size of the total population and its composition by age and sex.
Emigrant	Canadian citizen or immigrant who left Canada to settle permanently in another country.
Immigrant	Person who has been permitted by immigration authorities to live in Canada permanently.
International Migration	Movement of persons between Canada and other countries.
Interprovincial Migration	Movement from one province/territory to another resulting in a permanent change in residence. A person who takes up residence in another province is an out-migrant with reference to the province of origin and an in-migrant with reference to the province of destination.
Intraprovincial Migration	Movement within the province from one Census Division to another resulting in a permanent change in resident
Median Age	Age “x”, such that exactly one half of the population is older than “x” and the other half is younger than “x”.
Migration	Permanent change of residence from one geographical unit to another.
Mortality Rate	It is usually measured as the number of deaths per 1,000 individuals of that population for a particularly time period.
Natural Increase	Net contribution of births and deaths to population change.
Net International Migration	Equal to: immigrants – emigrants + returning emigrants – temporary emigrants + net non-permanent residents
Net Interprovincial Migration	Difference between in-migrants and out-migrants for a given province or territory.
Net Migration	Difference between in-migration and out-migration for a given area and period of time.
Net Non-permanent Residents	Variation in the number of non-permanent residents between two dates.
Net Temporary Emigrants	Variation in the number of temporary emigrants between two dates.
Net Undercoverage	Difference between the number of persons who were covered by the census but who were not enumerated (i.e. undercoverage) and the number of persons who were enumerated whereas they should not have been or who were enumerated more than once (i.e. overcoverage).
Non-Permanent Residents	Persons from another country who had an employment authorization, a student authorization, or a Minister’s permit, or who were refugees claimant, and family members living with them.
Permanent Resident	A person who is legally in Canada on a permanent basis as an immigrant or refugee, but not yet a Canadian citizen.
Population Growth	Total change in population of a given geographic unit in a given period, resulting from births, deaths and migration.
Population Projection	An estimate of a future population derived from calculations made on certain assumptions that determine the future course of population change.
Population Pyramid	A chart shows the distribution of a population by age and sex.
Replacement Level (Fertility)	Mean number of births per woman necessary to assure the long-term replacement of a population for a given mortality level. Currently, the replacement level in Canada and most other developed countries is about 2.1 children per woman.
Returning Emigrants	Canadian citizens or landed immigrants who have emigrated from the country and subsequently returned to Canada to re-establish a permanent residence
Shadow Population	It refers to those individuals who reside in one region on a temporary basis, while their primary residence is located somewhere else. They are enumerated by the census as residents of the jurisdictions where their primary residence is located.
Temporary Emigrant	Canadian citizen or immigrant who left Canada to settle temporarily in a foreign country.
Total Fertility Rate	The sum of age-specific fertility rates during a given year. It indicates the average number of children that a generation of women would have if, over the course of their reproductive life, they had fertility rates identical to those of the year considered.
Youth Dependency Ratio	Ratio of children age 0 to 14 years to the labour force population (aged 15 to 64).
